

THE RISKS OF CLIMATE CHANGE ON THE MOST VULNERABLE SPECIES AND ECOSYSTEMS

Dr. Nina Bednarsek, SCCWRP

FRIDAY, OCTOBER 2 • 7-9pm
CABRILLO MARINE AQUARIUM
Join us for this online lecture!

The negative effects of climate change on the global oceans are rapidly intensifying with respect to ocean acidification, oxygen decline and warming, and are resulting in a decline of suitable habitats for vulnerable species. These effects are taking place globally, with the California coast being one of the most susceptible regions for future climate change impacts. This talk will explore the drivers and mechanisms that make marine species vulnerable to climate change and provide insights on how we are able to detect changes that are linked directly to human-made climate change.

Dr. Nina Bednarsek currently leads research at the Southern California Coastal Water Research (SCCWRP) related to understanding the biological effects and risks of climate change in marine organisms. She specializes in determining the tipping points related to ocean acidification in combination with other stressors on the most vulnerable calcifying species that are of ecological and economic importance.

UPCOMING LECTURES

- November 8, 2020
Dr. Nicole Bonomo, CSUF
- December 4, 2020
Dr. Jayson Smith, Cal Poly Pomona
